PSALS: Port Scanning and Lockdown System

Introduction

- The digital landscape is full of hidden threats. Leaving ports open is like leaving your windows unlocked.
- PSALS provides visibility, protection, and actionable remediation.
- Built in Python, the system scans ports, identifies vulnerabilities, and guides users on how to secure them.
- After reviewing common industry vulnerabilities, I am confident that my custom Port scanning and lockdown warning system (PSALS) can provide the visibility you need to secure your infrastructure.

What is PSALS?

- A lightweight, custom-built port scanner.
- Designed to audit network security quickly and accurately.
- Detects open ports, identifies risks, and provides remediation advice.
- Live demo/app: psals.lovable.app

Why Port Scanning Matters

- Open ports are common entry points for attackers.
- Ports like 21, 23, 80, and 443 are frequently targeted.
- PSALS identifies these risks before an exploit occurs.

How PSALS Works – Technical Overview

- 1. Multi-threaded Port Scanning
- Traditional scanning loops are slow.
- PSALS uses Python threading to scan hundreds of ports at once.

- 2. Banner Grabbing
- Captures service banners (e.g., Apache 2.4.41 on Port 80).
- Helps identify outdated or vulnerable software.

- 3. Remediation Dictionary
- Port 23 (Telnet) → High Risk. Recommendation: Close Port 23 and use SSH (Port 22).

Key Features

- • Fast, multi-threaded scanning
- • Real-time vulnerability detection
- • Service identification via banner grabbing
- • Clear remediation guidance
- • Security dashboard summarizing system posture
- • Instant notifications for critical vulnerabilities

Project Objectives

Operational Security – Detect threats early and prevent attacks.

Educational Awareness – Explains why a port is dangerous.

Compliance – Ensures only necessary services and ports remain active.

Project Scope

- Intrusion prevention and detection
- Security management dashboard
- Vulnerability reporting
- Threat monitoring
- Incident management

Customer Testimonials

- “This might be the best port scanner ever. I’ve never seen anything like it.”
- “It’s tremendous.”
- “What would I do without this port scanner telling me Port 23 is open every time I boot up.”

Port Scanner Architect

Pricing Summary

PSALS – $300

INSTALLATIONS – $0

TOTAL: $300

Conclusion

- PSALS provides a powerful, educational, and actionable approach to cybersecurity.
- It identifies vulnerabilities, explains risks, and guides remediation.
- A lightweight but effective first line of defense.
